

$67 - 52 =$

First you need to make sure that you have the smallest number at the beginning of the number line. This is because you are going to count up to the larger number to work out the difference.

Frog will jump to the next ten. This means he is jumping to the number 60.

Finally he will jump to 67. Then you have to add up the amount Frog has jumped so the answer is 15.

Have a go at the following calculations:

1.  $53 - 47 =$
2.  $87 - 71 =$
3.  $29 - 18 =$
4.  $45 - 37 =$
5.  $66 - 54 =$
6.  $98 - 86 =$
7.  $27 - 12 =$
8.  $69 - 58 =$

Make sure you draw the line to show you are using the frog method.
